

# Change Analysis

Another experiment to look at rate of change. Idea here is to compare the reported change against the cumulative sum.

Last date for states data is 2020-07-20

## Extract daily changes

### Daily Cases

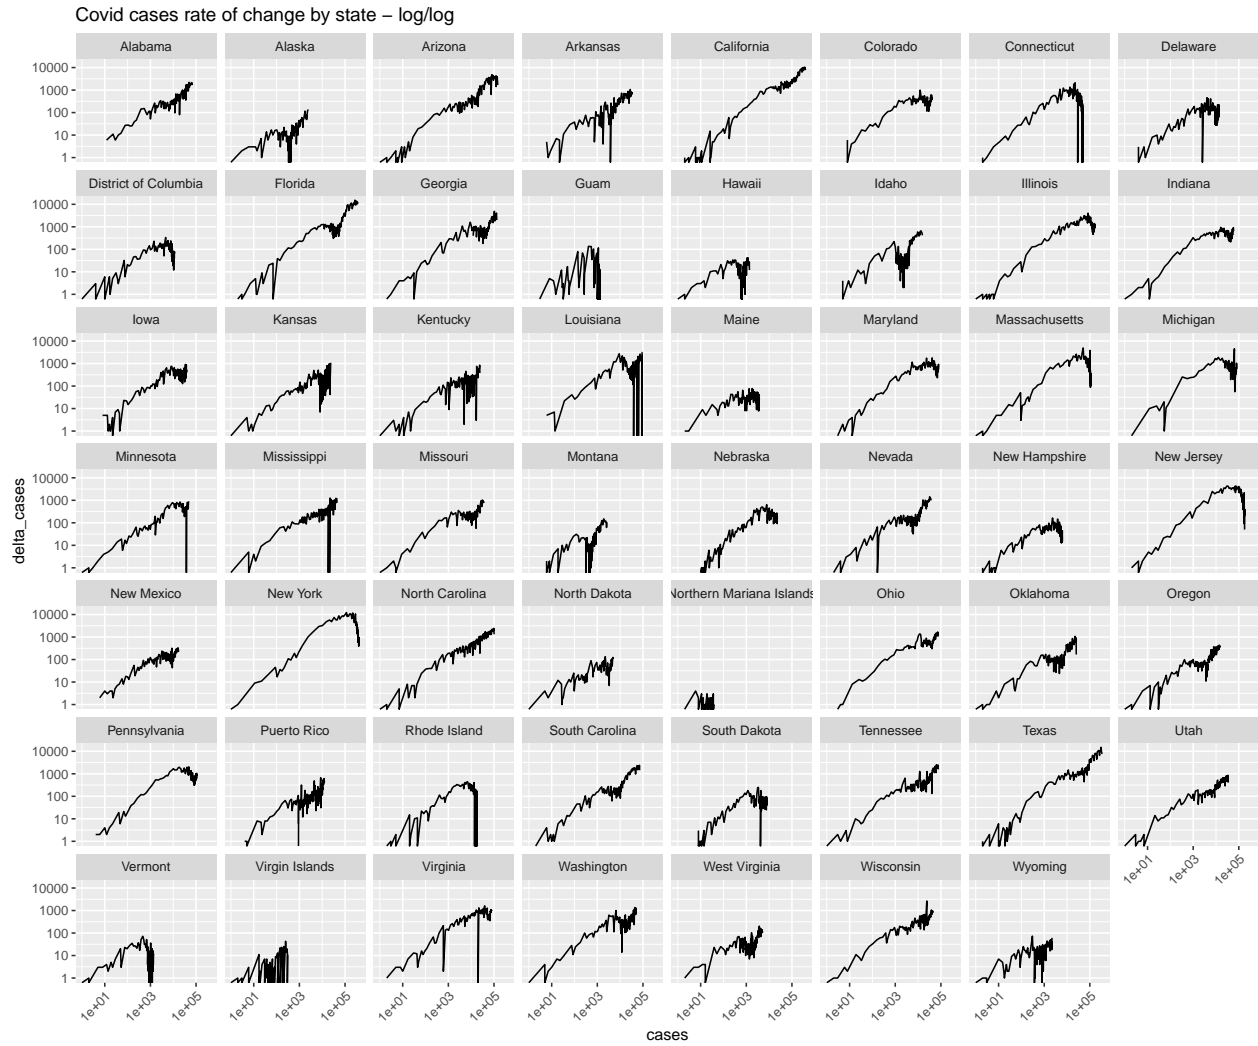

## Daily Deaths

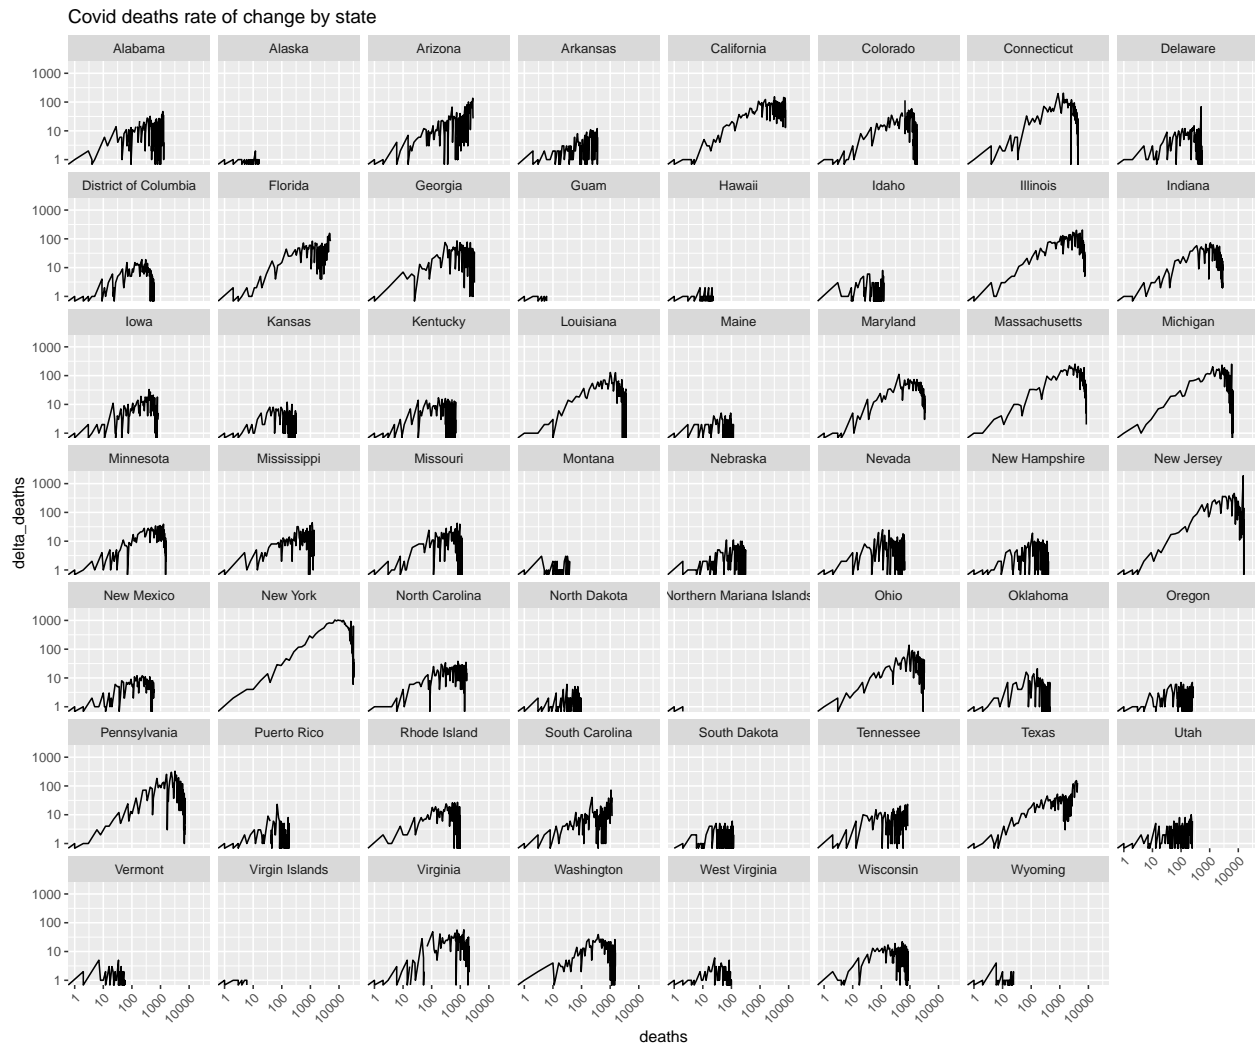

## Log of Change Over Cumulative Sum

Linear values are skewed by higher-magnitude values, so use a  $\log(10)$  on each axis. this better fits the exponential nature of the data anyway.

## Log/Log of Cases Over Cumulative Sum

## Log/Log of Deaths over Cumulative Sum

## Weekly Rate of Changes

In order to smooth out the curves in the previous graphs, look at them on a weekly basis.

```
## `summarise()` regrouping output by 'state' (override with `.groups` argument)
```

## Weekly Range of Change of Cases by State

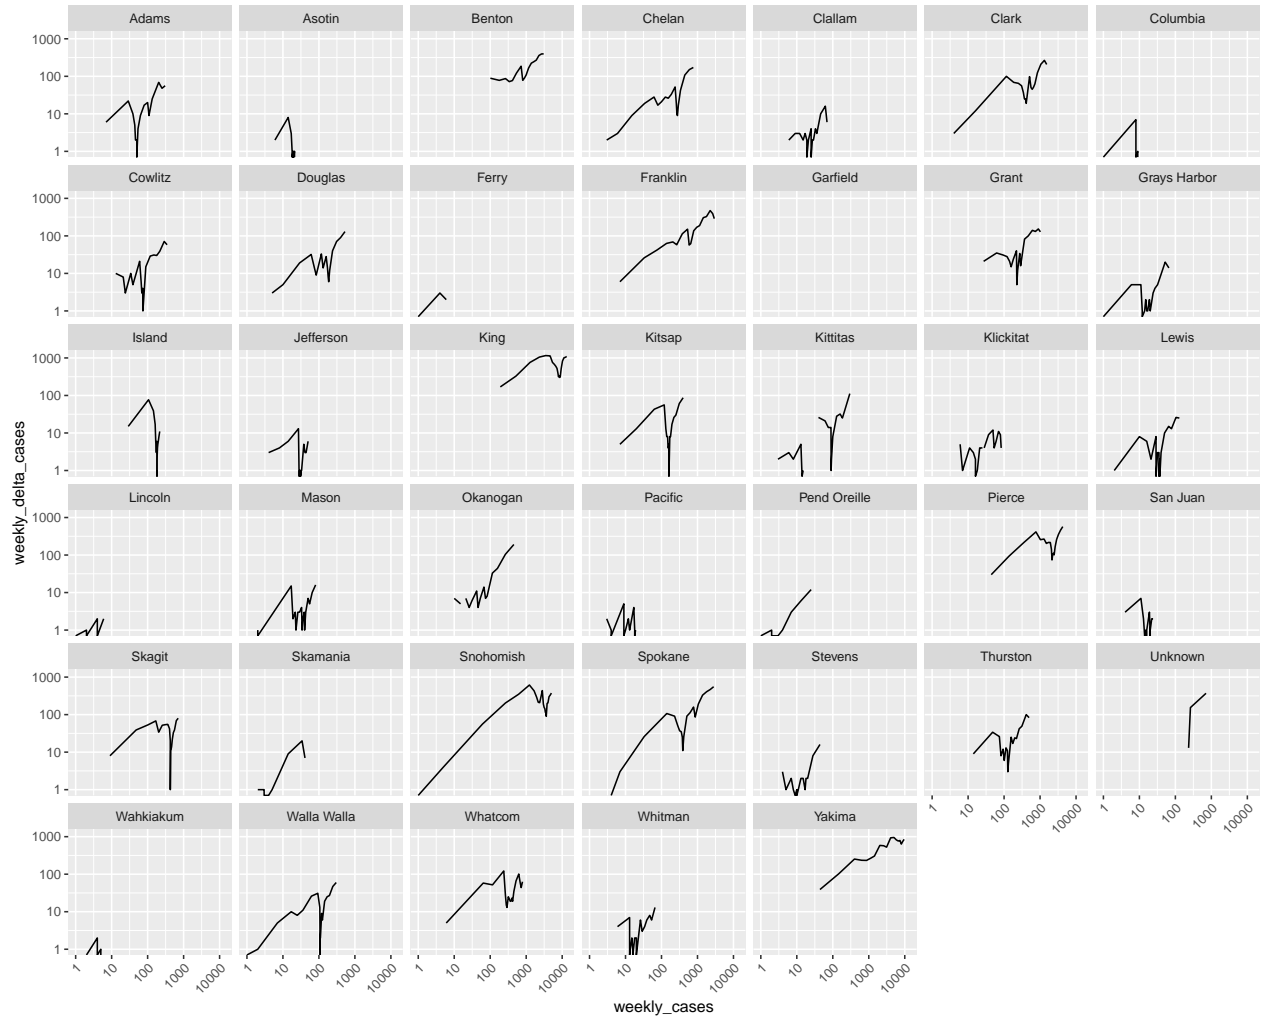

## Weekly Range of Change of Deaths by State

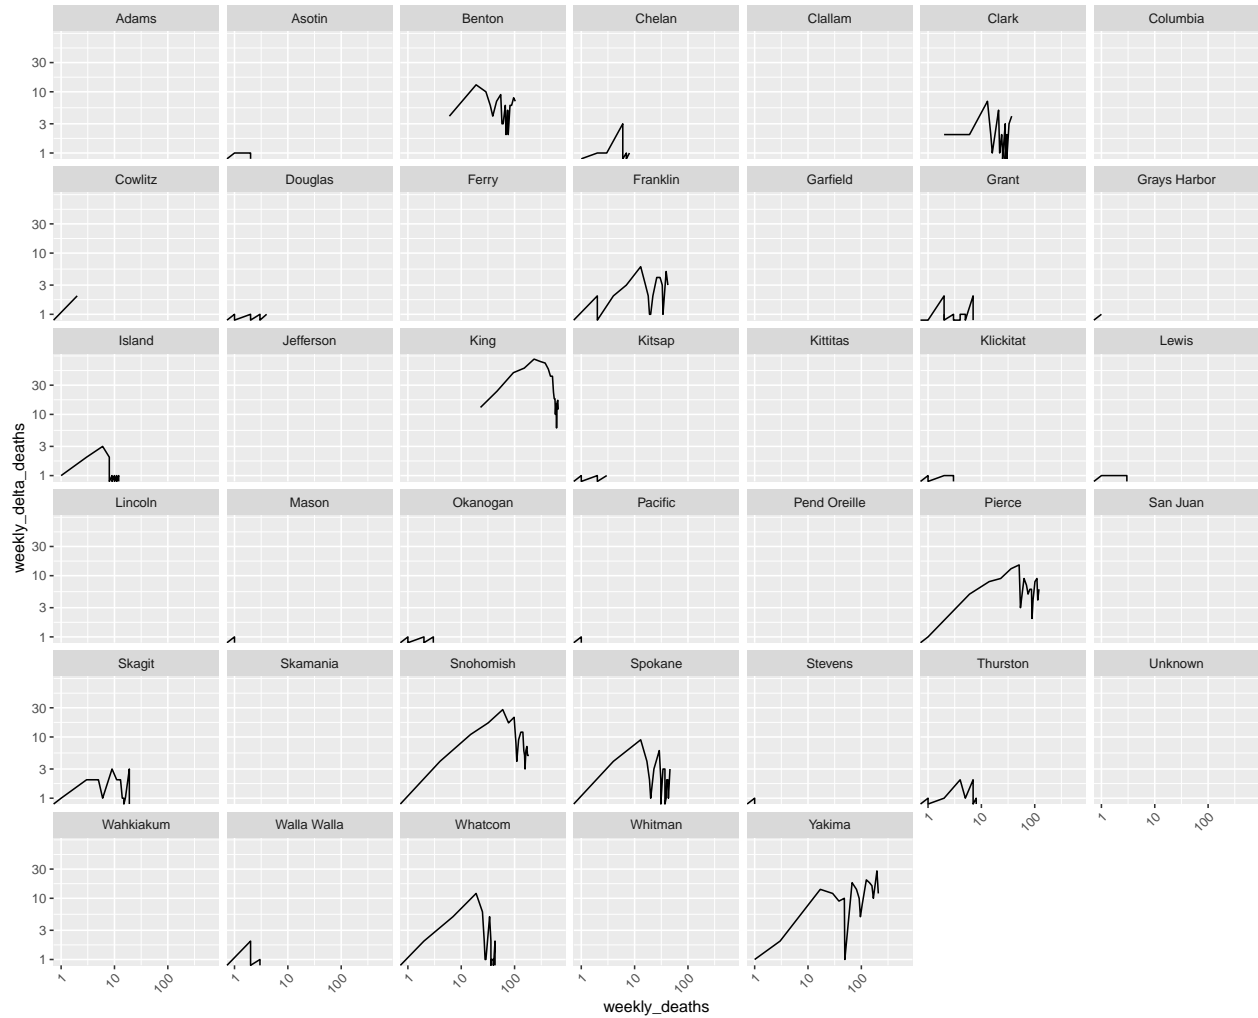

## Washington Counties

## `summarise()` regrouping output by 'county' (override with `.groups` argument)

Covid – log/log weekly cases rate of change by WA Counties

Covid – log/log weekly deaths rate of change by WA Counties

## California Counties

## `summarise()` regrouping output by 'county' (override with `.groups` argument)

Covid – log/log weekly cases rate of change by CA Counties

Covid – log/log weekly deaths rate of change by CA Counties
